

# Variable Name Assistant

A name of a variable is used for WEB forms, MS Word templating, and data reporting. The names should be understandable by humans and software. For each name should be defined on-screen labels for English and local languages.

## The Roadmap

Select an existing first ..... 1

Edit on-screen labels or add a name, if necessary ..... 2

## Select an existing first

The Variable Name Assistant proposes the selection of variable names from existing, and, if necessary, edit labels or add an entire new variable.

1. A label in English is a source of variable names. This is because names must contain Latin characters
2. Button “Assists” proposes a name created using an English label
3. Label in the local language is mandatory
4. Restore the initial name of a variable
5. Accept the name
