

# An example of resource definition

The component “resources” intends to create documents in docx format using pre-defined templates and application data. Examples are certificates and letters. Before this release configuration process of a “resource” component was complex and cumbersome.

Suppose, we need to create a resource to allow the creation of various letters from NRA to an applicant

**Select "Administrate-Configuration-Resources" and create the templates in the docx format. Use “EL reference help” while creating the templates.**

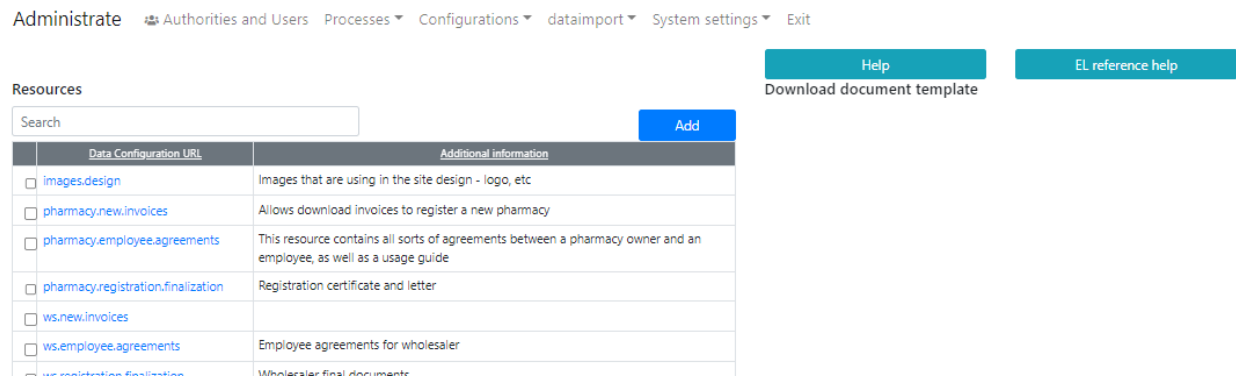

Figure 1 Initial resource configuration screen

**Press “Add” and fill out the form**

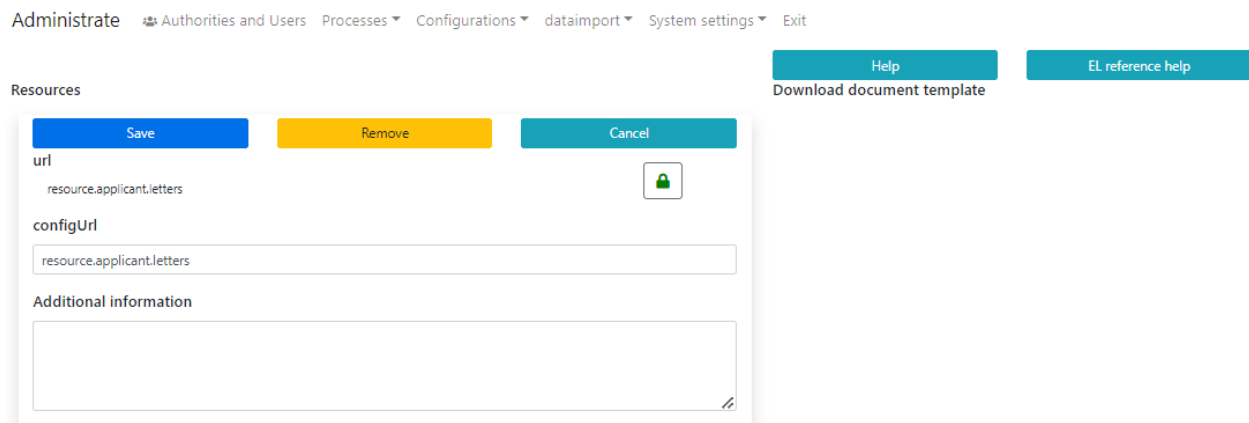

Figure 2 Resource configuration form

## Press “Save to create an empty resource” and, then, find the newly created resource
